

STEP 1 SETTING UP AN EXISTING PROJECT IN VISUAL STUDIO

Click **“Create a new”** to set up a C++ project in visual studio.

Select an **empty** project, and click **next**

Give a name to your project and click the **create** button AND check the box “Place solution and project in the same directory”.

Right click on “Source files” to add an existing file (a file with extension .cpp downloaded from onlinegdb)

Click on “Existing Item ... ” and find one of the cpp files you downloaded from online gdb

After the file is loaded, you can run, debug, and test your program by clicking the “Local Windows Debugger” button at the top of the screen, as shown below:

STEP 2 CONNECT PROJECT TO GITHUB

Right click on the **Solution**

Click on “Create Git Repo”

STEP 3 CREATING A GITHUB ACCOUNT

(Skip if you already have a Github account)

Create an account on Github... go to **github.com**

The image shows the GitHub sign-in page. At the top is the GitHub logo and the text "Sign in to GitHub". Below this is a form with two input fields: "Username or email address" containing "jreyes.utrgv" and "Password". A "Forgot password?" link is next to the password field. A green "Sign in" button is below the fields. At the bottom, there is a link "Sign in with a passkey" and a link "New to GitHub? Create an account" which is highlighted with a red arrow.

Enter your email address and follow the registration process.

STEP 4 LOG INTO GITHUB FROM VISUAL STUDIO

Before we log into Github, you should verify the information in the “**Create a new Github repository**”. This is where you will set the name and visibility of your repository.

The image shows the "Create a Git repository" dialog in Visual Studio. The "Push to a new remote" section has "GitHub" selected. The "Initialize a local Git repository" section shows fields for "Local path" (C:\Users\mus637\source\repos\First Project), ".gitignore template" (Default (VisualStudio)), and "License template" (None). The "Create a new GitHub repository" section is highlighted with a red box and contains fields for "Account" (Sign in...), "Owner", "Repository name" (First Project), "Description" (This is the first project for CSCI 1101), and a checkbox for "Private repository". A warning message states: "Your new repository will be created as First-Project." Buttons for "Create and Push" and "Cancel" are at the bottom right.

To proceed, click the “Account” drop-down, and login.

You might need to authorize communication between Visual Studio and Github. If needed, click “Authorize github” green button.

If no issues, you will see this screen

Now go back to Visual Studio.

Make a change to the cpp file. This will notify Visual Studio that this file was modified and needs to be synchronized to the repository.

At this point we can **commit** the file(s) that were updated from the local repository (your machine) to the remote repository (GitHub).

To do so,

- (1) enter a brief message describing the change/fix and
- (2) click **Commit All** (or **Commit Staged**).

Once you commit your changes to your local repository, the changes have been saved to the local repository. However, you still need to upload (**push**) this version to the remote repository (GitHub).

To get the latest version from GitHub, you do a **pull** request.
