

Deploying Your HTML/CSS Website on Vercel

Intro to Computer Science

1 Goal

Deploy a simple website built with `index.html`, `style.css`, and images (like `PFP.JPG`) to the web using **Vercel**. You'll go from local files to a public link in about 15 minutes.

2 Before you start

- You have a GitHub account.
- Your project is committed and pushed to a GitHub repository.
- Your folder structure looks like this:

```
project/  
|-- index.html  
|-- style.css  
`-- PFP.JPG
```

Important: File names on Vercel are case sensitive. If your HTML uses `` but the actual file is `PFP.JPG`, the image will not display. Fix one or the other.

3 Step 1 — Create a Vercel account

1. Visit vercel.com.
2. Click **Continue with GitHub** and authorize access.

4 Step 2 — Import your GitHub repository

1. On your dashboard, click `Import Project`. See Figure 1.
2. Select your GitHub repository (Figure 2).
3. Vercel will automatically detect a **Static Site**.
4. Leave all settings at default and click `Deploy`.

5 Step 3 — Deployment complete

After a short build, Vercel gives you a public link such as:

`https://your-project.vercel.app`

Every time you push new commits to the main branch, Vercel redeploys automatically.

Figure 1: Click Import Project to connect your site repository.

Figure 2: Choose your GitHub repository and click Import.

6 Step 4 — Verify your website

Once deployed, open your Vercel link and confirm:

- The layout and colors match your local version.
- Images and text display correctly.
- Links and navigation work properly.

Minimal README.md example

```
# My First Website
```

```
A simple portfolio webpage.
```

```
## Live Site
```

```
https://your-project.vercel.app
```

```
## How it was built
```

```
HTML and CSS only. Deployed using Vercel.
```

```
## Deployment steps
```

1. Push code to GitHub.
2. Import repository on Vercel.
3. Click Deploy.
