

HISTORY OF COMPUTER SCIENCE

CSCI 1101 - Introduction to Computer
Science

+

○

IMPORTANT NAMES

Alan Turing

Tim Berners-Lee

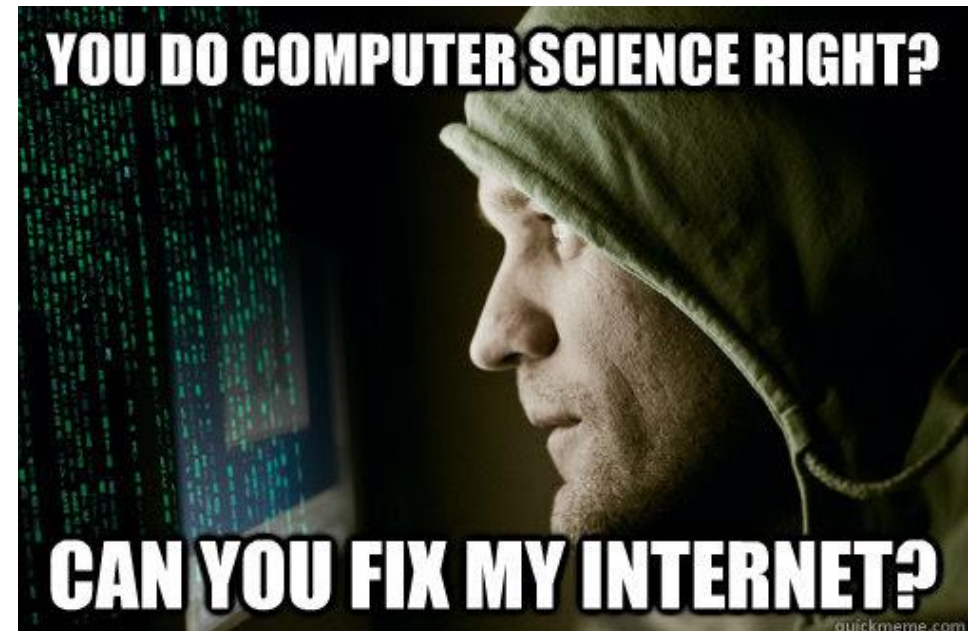

Steve Wozniak

Linus Torvalds

What is Computer Science?

Computer Science is the study of computers and how they work, including their hardware, software, and applications

As a CS student you will learn not only programming languages, but also how to design computer systems, how people interact with computers, how to handle large amounts of information, how to build networks, create websites, video games, artificial intelligence, robotics, and much more.

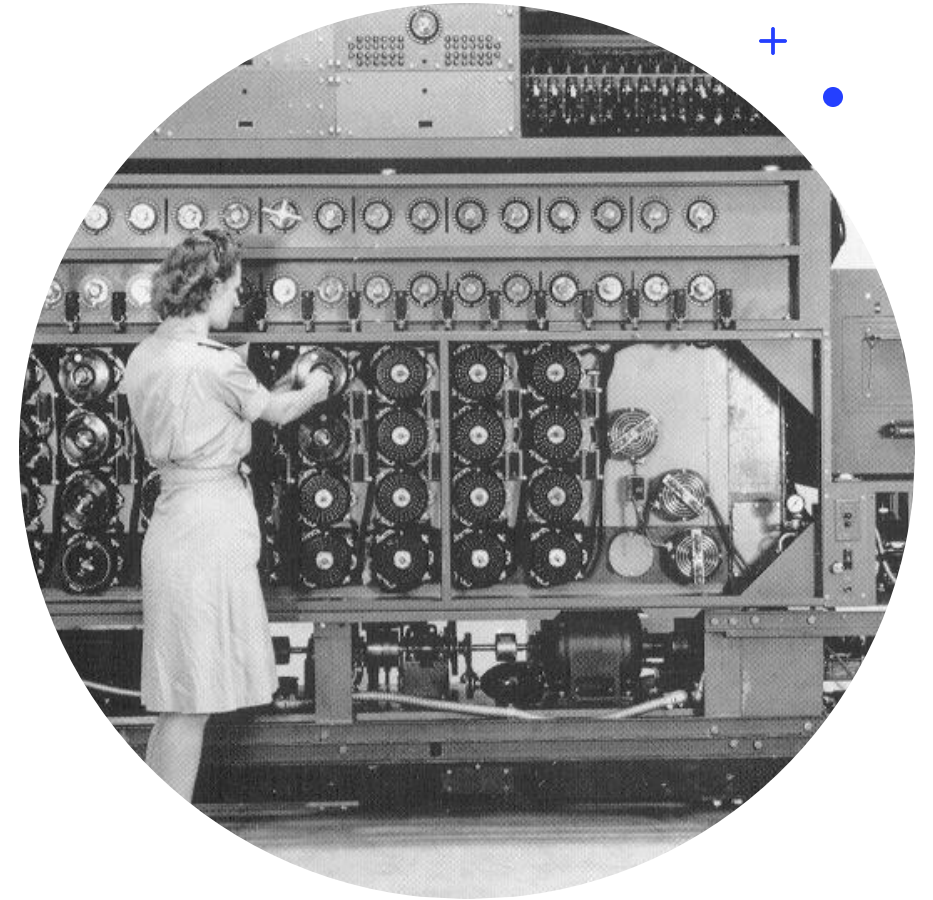

The First Modern Computer

Alan Turing is known as the “Father of Computer Science.”

In 1941, British scientists led by [Alan Turing](#) create the British Bombe used to crack the Nazi Enigma code.

In 1945, Turing is recruited by the National Physical Laboratory in London to create an electronic computer with the first complete specification of an electronic stored-program all-purpose digital computer.

Harvard Mark 1

In 1944, International Business Machines Corporation (IBM) builds the [Harvard Mark 1](#), a room-sized, relay-based calculator. The machine had a 50-foot-long camshaft running the length of machine that synchronized the machine's thousands of component parts and used 3,500 relays. The Mark 1 produced mathematical tables but was soon superseded by electronic stored-program computers.

SSEC (Another Big Calculator)

In 1948, IBM builds the [Selective Sequence Electronic Calculator](#) (SSEC). The SSEC played a crucial role in the early planning of the Apollo XII moon landing in 1969.

First Commercial Computers

In 1950, ERA 1101, Pilot ACE, [Univac](#), and SEAC are produced commercially. SEAC was built as a test-bed for evaluating components and systems as well as for setting computer standards. The world's first scanned image was made on SEAC by engineer Russell Kirsch in 1957.

First Mass Produced Computer

In 1954, IBM establishes the 650 as its first mass-produced computer, with the company selling 450 in just one year.

The IBM 650 had a 65 KB storage capacity.

First “Personal” Computer

In 1962, the [LINC](#) is an early and important example of a ‘personal computer,’ that is, a computer designed for only one user. It was designed by MIT Lincoln Laboratory engineer Wesley Clark.

Apple Personal Computer

In 1976, Apple I is released and created by Steve Wozniak (not Steve Jobs).

The Apple I had 4 KB RAM and 456 KB storage.

Windows I

In 1985, Windows I is released and developed by Scott A. McGregor.

Windows I had 256 KB RAM and ~512 KB storage.

World-Wide-Web

In 1989, Tim Berners-Lee invented the World Wide Web. The web was originally conceived and developed to meet the demand for automated information-sharing between scientists in universities and institutes around the world.

Linux

In 1991, Linux a Unix-like (Apple) operating system created by Linus Torvalds is released. Linux aimed to be a free software. Today Linux is used in almost all Android phones.
