

Once a collaborator accepts access to the repo, the collaborator can **clone** the project on their local Visual Studio environment.

NOTE: All the steps outlined below must be performed by the collaborator.

Step 1. Access the repo from the person who invited the collaborator.

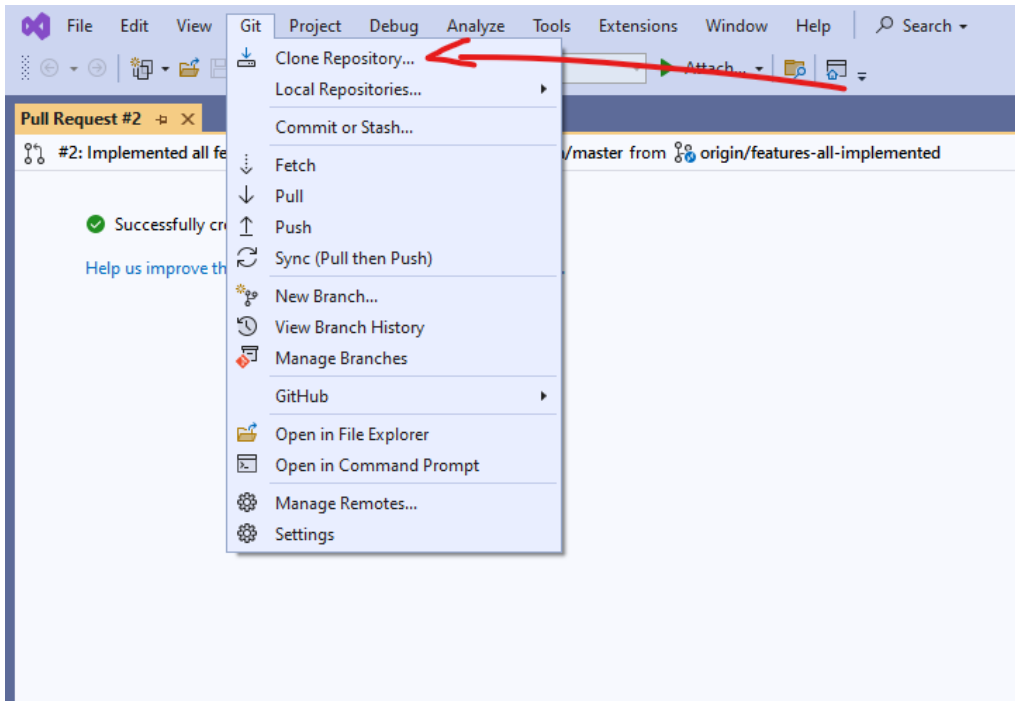

Step 2. Click on the green button “<> Code”, select HTTPS, and click the “copy” button as indicated below

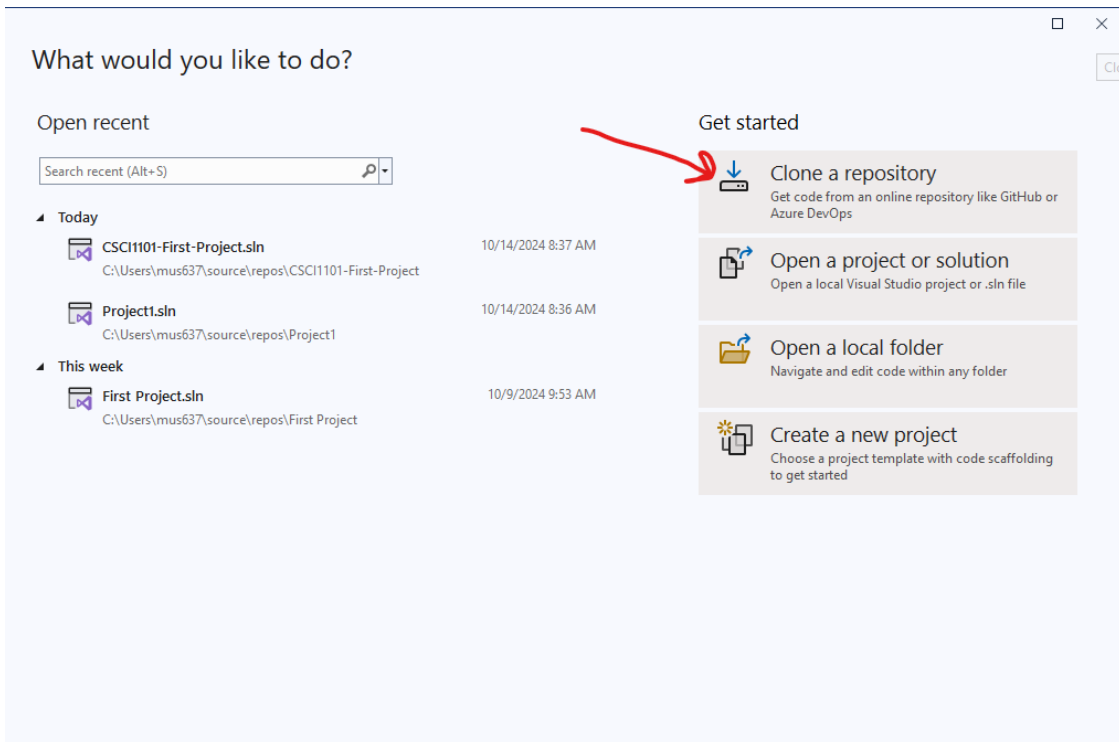

Step 3. Go to Visual Studio. Close all solutions, if any opened.

Step 4. Clone the repo, there are 2 methods:

Method 1 From the Git menu, click "Clone Repository"

Method 2. From the “Get started” view, that opens when Visual Studio opens for the first time.

At this point, your local repository has a copy/snapshot of the project. However, if for any reason, you do not see the project, you need to update Visual Studio's main view. To do so, click on the area as indicated in the image below to switch the view.
