

# Computer Architecture

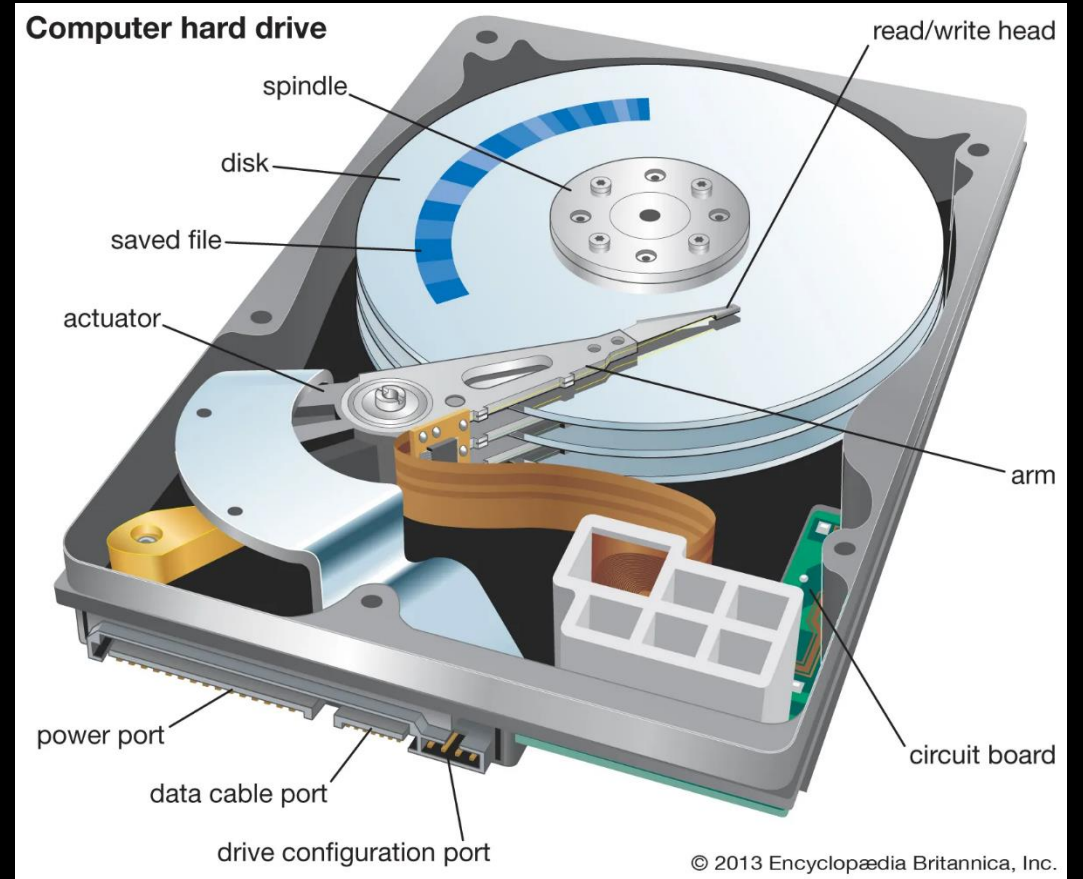

CSCI 1101 – Introduction to Computer Science

# Main Components of a Computer

- CPU (Central Processing Unit)
- GPU (Graphical Processing Unit)
- Main Memory or RAM (Random Access Memory)
- Storage Drive
- Motherboard
- Input/Output
- Buses

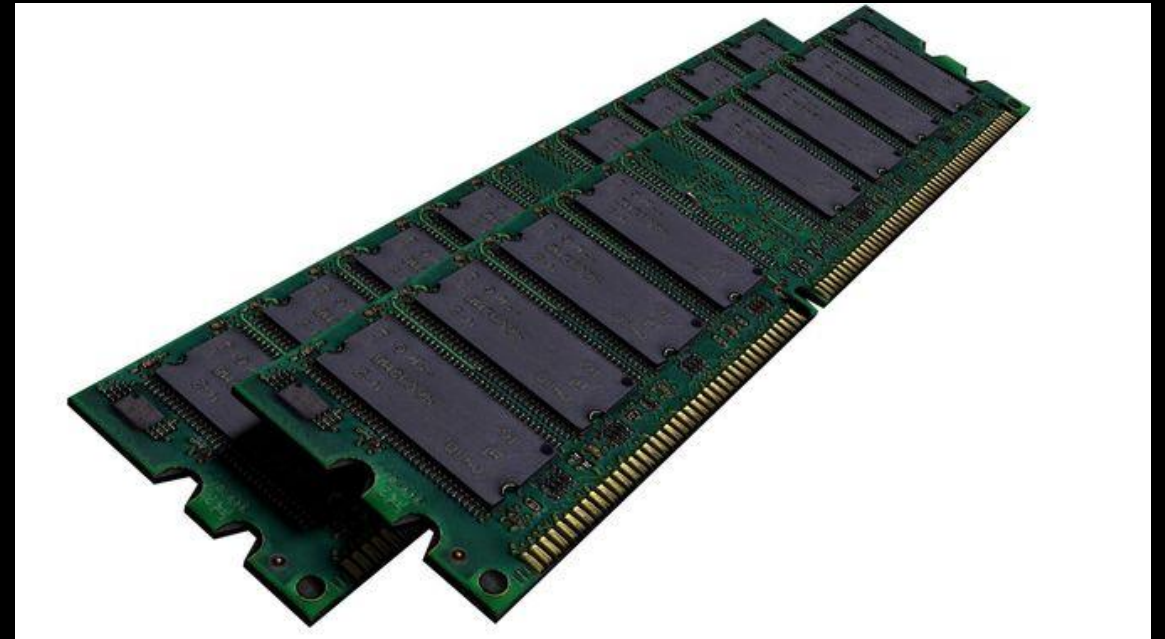

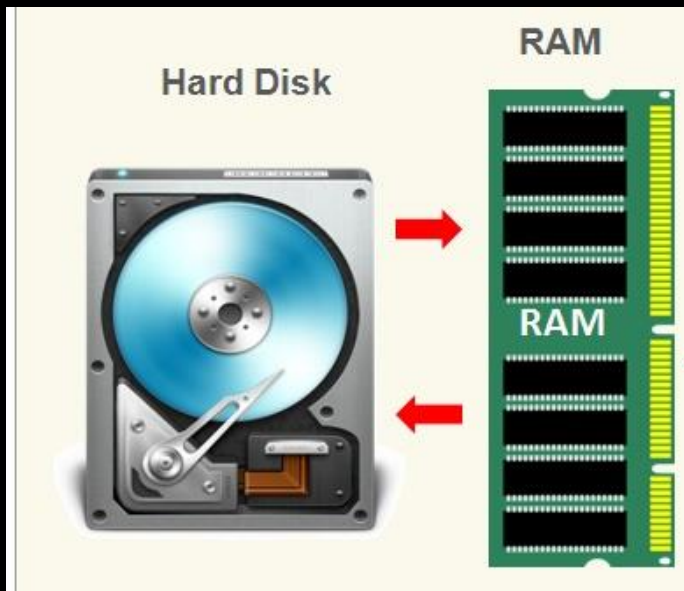

# Storage Drive

- Where your computer stores all its applications, games, files, and operating system.

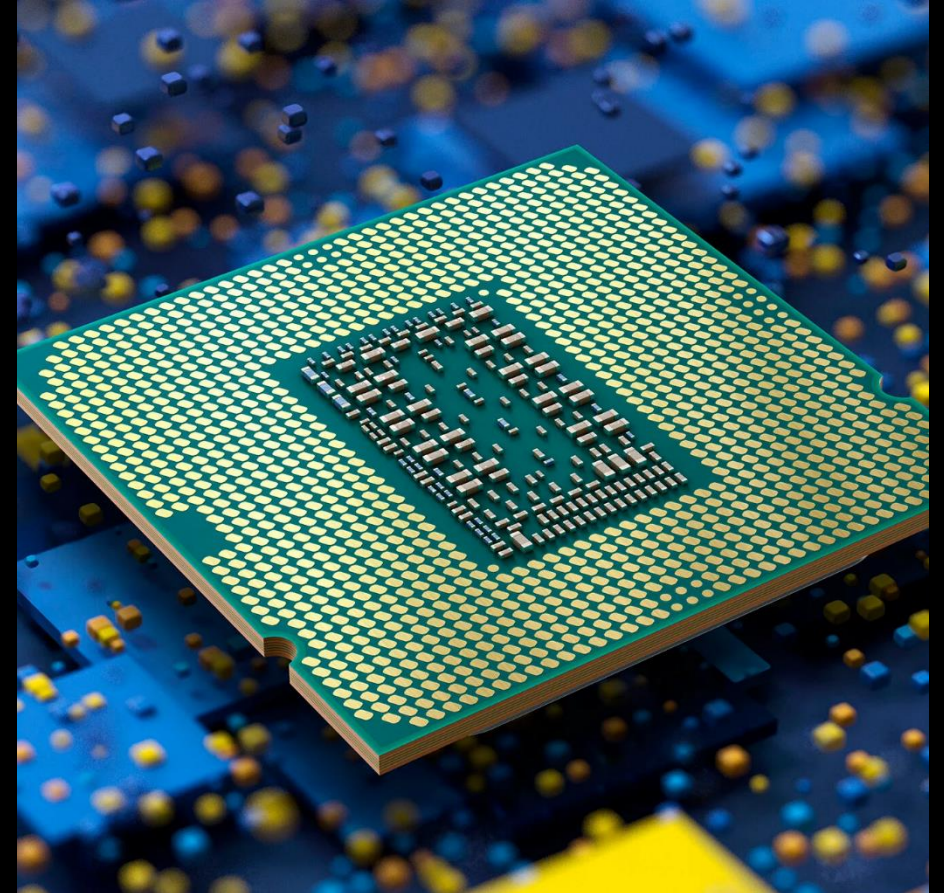

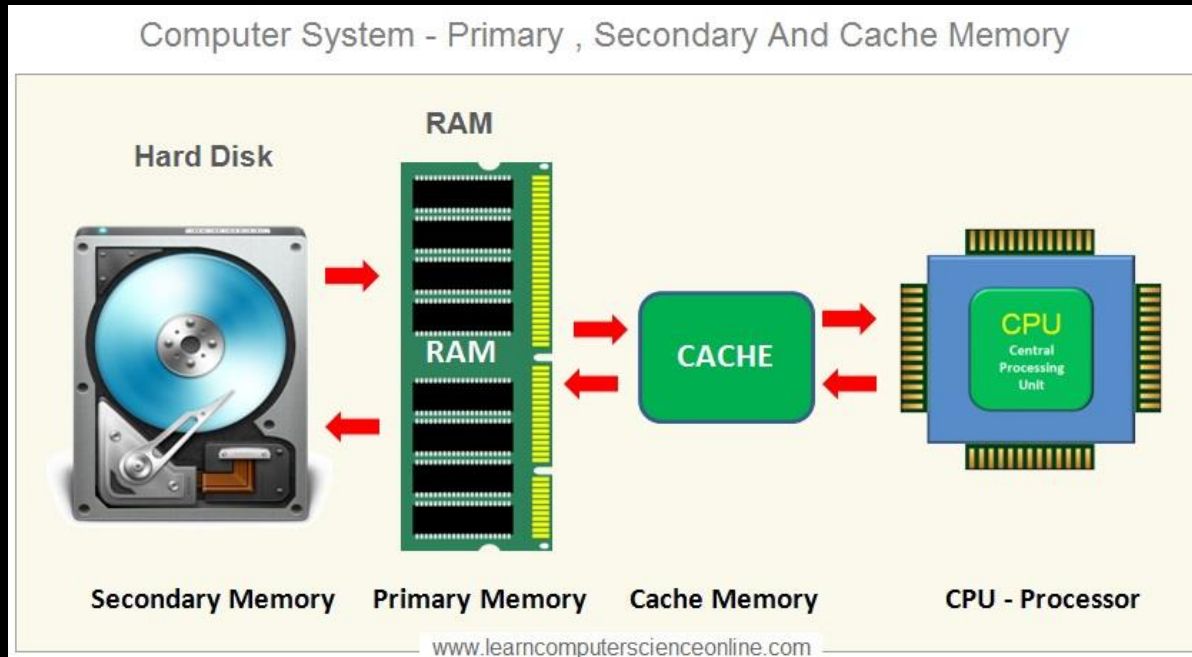

# Main Memory

- Where resources your computer is currently using or will be using from storage are temporarily stored.

# CPU

- The brain of the computer. The CPU does all the processing.

# Graphical Processing Unit

- A **GPU** is a chip that processes many tasks at once, mainly used for graphics and speeding up computing. It helps render images, run games smoothly, and accelerate AI or data processing faster than a CPU alone.

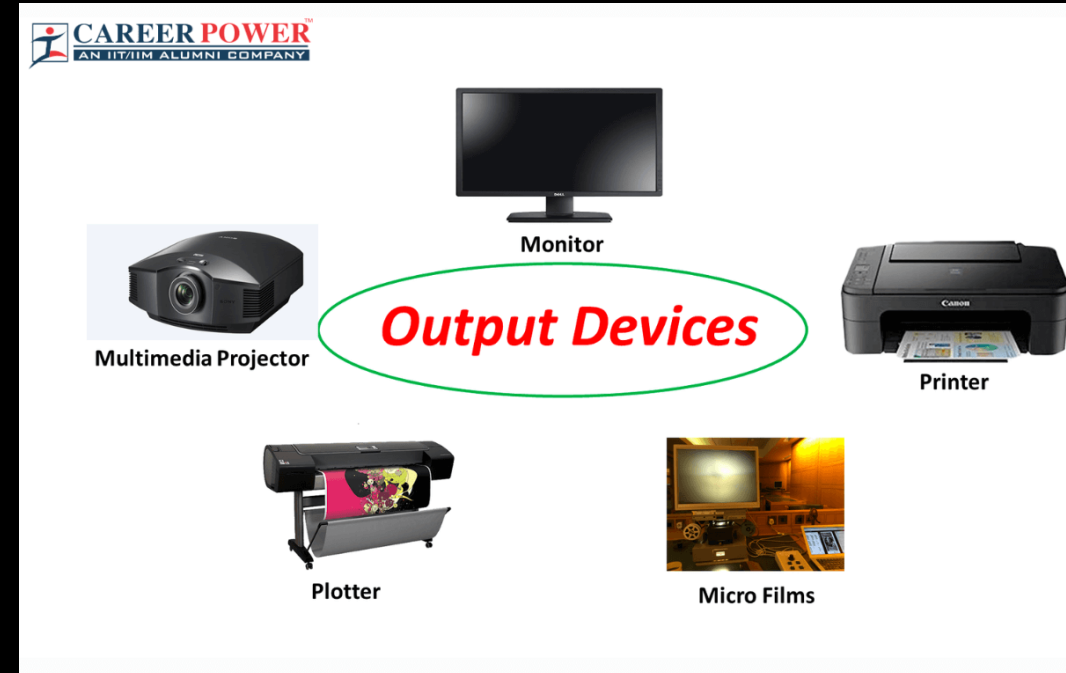

# Motherboard

- Backbone of the computer.  
Connects all main components and allows them to communicate with each other.

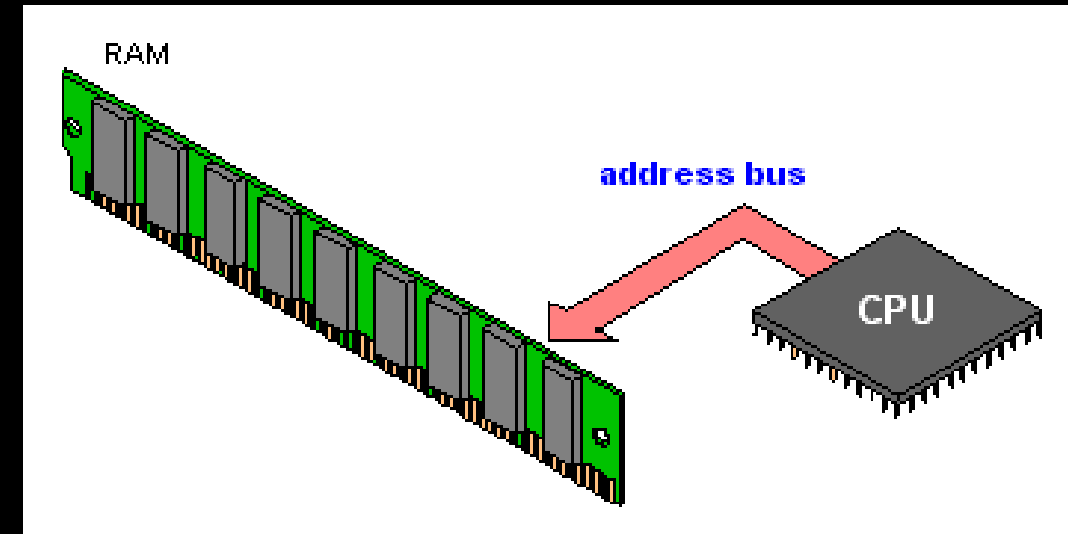

# Input/Output

- Devices users can use to communicate with their computer. Input devices include keyboard, mouse, and touchpad. Output devices include monitor, printer, and speakers.

# Buses

- Are how different components on the motherboard use to communicate and transfer power and/or data.

Cable Buses

Buses - Connection Cables

Motherboard Buses

Buses - Motherboard Buses

Thank You
